1994-1995 MUSTANG STRUT TOWER BRACE INSTALLATION INSTRUCTIONS

The purpose of the strut tower brace is to strengthen the chassis and prevent shock tower flexing under hard cornering.

- 1) If you are upgrading a Mustang with an existing strut tower brace, remove the old brace with a 10mm wrench

If your car came with a strut tower brace from the factory, you can re-use the original hardware. If not, you must use the new bolts supplied.

- 2) Place the new brace over the engine so the brackets rest on the strut towers and against the firewall.
- 3) Line up the holes in the brace with the pre-existing holes tapped in the car from the factory. Place washers under the bolts and thread them into the car. Use the large washers under the two bolts at the firewall. Use the remaining 6 bolts and washers at the strut towers.
- 4) Start all the bolts first, then tighten.
